BRING ON THE BEAST!

New Zealand's Beast is eating up timber – and that's the solution, not the problem! Unwanted waste wood makes up 12% of all waste filling up the Kiwi nation's landfill sites. EnviroNZ's new heavy machinery, known as "the Beast" chews up waste wood and converts it into wood pellets. Those pellets are then sold to a cement factory which uses them as biofuel. This keeps construction and demolition timber out of landfill sites and reduces the use of fossil fuels – a double win, courtesy of the Beast!
